Thanks. This is pretty interesting. The tritium data is pretty interesting. What do you think of the data in the NED paper, then? It looks like they report 4 tests and found elevated tritium in 3 of them. Do you think this is inadequate statistics compared to your study.

I would like to ask some things about the paper you sent;

How many chambers did you make and test?

When did you first start writing this up? Did you have a draft as early as January 2005, or only after Avignon?

Question about where Xu and Butt were working: were they working in a space allocated to your lab, or Rusi's lab? When did you learn about their work for the first time?

I also wondered if you did tell Emil not to press release the work in July, when you were cc'd, or, only realized it was an odd situation after you saw the press release come out?

Best Wishes,
Eugenie

Eugenie, FYI please take a look at this exchange with Dr. Jay Gore who is objecting to the no press release position. As I have not let Jay know about the sharing of this exchange, I will appreciate if you treat it as confidential info.

Best.
Lefteri
