# Oscillatory and Directional Emission Properties of Transition Metal Catalysts – Systems with Statistical Reliability

Michael E. Melich

W.E. Meyer Institute of Systems Engineering  
Naval Postgraduate School  
Monterey, CA 93943-5000

## Summary

- The properties of transition metal catalysts as investigated by the petroleum industry chemists should be of interest to Fleischmann Pons Effect researchers.
- The use of functional analysis to understand what tasks we are asking the various components of our experiments to perform may be useful determining where bottlenecks may exist that lead to unreliable FPE experiments.
